The lemma says the following: Let Y be a random variable, $T \geq 1$ a real number and $\epsilon > 0$. If $$\mathbb{E}[|Y|] \leq \epsilon \sqrt{Var(Y)},$$ then $|Y| \leq C_T\epsilon$ with probability $1 - \exp(-2/T^2)$. The proof is given in the reference to the lemma. First of all, why is ϵ a real number and C_T is a constant? I am interested in the generalised case of $\mathbb{E}[|Y|] \leq \epsilon \sqrt{Var(Y)}$ for general Y for $T \geq 1$ a real number. Let $\tilde{$

Pleomorphic xanthoastrocytoma is a neoplasm that most commonly presents in children. The tumors tend to have an excellent prognosis after surgical resection, but we have encountered cases in adults that had a more aggressive course. We report two such cases, which presented as aggressive, rapidly enlarging lesions. Magnetic resonance imaging revealed well-demarcated, intensely T1- and T2-weighted hyperintense mass lesions. Signal characteristics were nonspecific. A diagnosis of xanthoastrocytoma was made on light microscopic examination. Fluorescence in situ hybridization studies demonstrated a loss of chromosome 22. In one case, the lesion was initially resected, but a local recurrence was detected within 2 months. In the other case, the lesion was completely resected. These cases demonstrate that pleomorphic xanthoastrocytoma is a neoplasm that is not confined to
