For more information on the development of AutoCAD and the software's history, read about AutoCAD — A History in Three Parts. AutoCAD Editor in Design Space From an initial programming standpoint, designing in AutoCAD can be broken down into three steps: sketching, rendering, and detailed design. Before you can even begin to sketch your design in AutoCAD, you must open the drawing and decide where to draw the lines and shapes in your sketch. An AutoCAD drawing represents a space in three dimensions, and it has an internal description of the geometry and color of the objects in that space. The process of drawing is a direct reflection of the internal structure of the space represented by the drawing. The drawing opens to a default drawing space and you can use your mouse to draw various items, including lines, circles, arcs, and text. The cursor can be moved by left-clicking in the drawing space or on the desired object. To draw something, right-click with the cursor and select a command from the menu that is displayed. For example, in order to draw a circle, you would right-click in the drawing space and select from a menu option that says Circle. In the top-left corner of the drawing space is a button called the Orbit tool, which when clicked moves the cursor across the drawing space. This tool is similar to a plane from a drafting program and works by interpolating between your current position and the target. The Orbit tool enables you to easily draw a line in a direction perpendicular to your current line. For example, when you have a line segment on one side of the line being drawn, you can click on the other side of the line, and the Orbit tool will move the cursor in a straight line to the target point. You can move your drawing space to any location in the drawing space simply by clicking in the drawing space and dragging. In the top-right corner of the drawing space is
