The isolation and characterization of hydrocarbon-degrading bacteria is crucial for the development of bioremediation of hydrocarbon-contaminated environments. A number of hydrocarbon-degrading bacteria were isolated from the sediment of a natural eutrophic reservoir. Analysis of 16S rDNA sequences revealed that most of the strains formed a distinct cluster within the genus Ochrobactrum. However, Ochrobactrum biformatum strain 17 was related to the genus Novosphingobium. The isolated strains were evaluated for their degradation capability on a variety of hydrocarbons and oils. The strains could metabolize a wide range of hydrocarbons. All strains were able to grow on crude oil, diesel, and crude oil plus water in a medium. Among the tested hydrocarbons, branched alkanes were metabolized more slowly
